

DOOR TECHNOLOGY – SECURY MULTI-POINT LOCKS

The next level daytime release function

For self-locking GU SECURY multi-point locks

What is a daytime release function and what does it do?

With the practical daytime release function, your door remains open and released during the day – there is no need to operate the entire locking system. Ideal if the door is frequently used, e.g. from the outside via a push/pull handle or fixed knob. Access remains easy and security at night is guaranteed. Perfect for everyone who loves flexibility and comfort!

A closer look at the GU SECURITY TE module

By introducing the GU SECURITY TE module and TE strikers and strips we are expanding the tried-and-tested SECURITY system technology to include an innovative feature.

Maximum flexibility thanks to straightforward retrofitting:

A GU SECURITY TE module set can easily be retrofitted to self-locking multi-point locks during the production process.

Optimised stock-keeping made easy:

The set is compatible with the tried-and-tested SECURITY system technology which significantly reduces the number of possible variants. Thanks to the ingenious combination with the standard lock, a separate lock variant with daytime release function no longer needs to be kept in stock. What this means for you: lower inventory costs, easier administration and greater efficiency in your warehouse.

Easy activation/deactivation:

Activating/deactivating the daytime release function is simple and uncomplicated with one-hand operation – **this is unique on the multi-point locking system market.**

Practical accessories:

The frame-side TE striker is a compelling choice as it is non-handed and can be flexibly adjusted vertically between +1.5/-3.1 mm. Alternatively, the TE strip is also available as an optional solution.
